

Fork Positioner for Forklift

Forklift Fork Positioners - A fork positioner is actually a device made out of high quality materials intended to endure the most difficult procedures and work environments. This piece of equipment could enable the individual driving to be able to maneuver the forks hydraulically without leaving the seat. Side shifting models have the extra ability to be able to laterally position the entire load or the arms in order to facilitate much more accurate lifting and placement in a faster and more effective way.

The blade pocket is quite unique and could enable the operator to safely sway the blades into position without any fear of damaging the positioning cylinders. This could allow the driver the alternative to execute simultaneous or independent fork movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages can be transformed into blade positioners on existing units.
